

Q4

Date: _____

Non-Preemptive :-

a) Gantt Chart :-

b)

response time:

$$P_1 = 0, P_2 = 6, P_3 = 3, P_4 = 7$$

waiting time:

$$P_1 = 0, P_2 = 6, P_3 = 3, P_4 = 7$$

Average waiting time:

$$\frac{0 + 6 + 3 + 7}{4} = 4$$

Turnaround time:

$$P_1 = 0 + 7 = 7$$

$$P_2 = 6 + 4 = 10$$

$$P_3 = 3 + 1 = 4$$

$$P_4 = 7 + 4 = 11$$

c). Since P_1 arrive at 0, it will immediately get processor.

• P_2 arrives at 2 and get CPU at 8, so response time is $8 - 2 = 6$ ms.

• P_3 arrives at 4 & gets CPU at 7 so its response time is 3

• P_4 arrives at 5, get CPU at 12.

Conclusion:-

The processes having shortest burst time will get the processor first & after ^{their} execution is completed. Other process will get the processor. In this manner, average waiting & turnaround time is improved.

Preemptive:-

a)

P_1	P_2	P_3	P_2	P_4		P_1
0	2	4	5	7	11	16

b) response time:

$$P_1 = 0, P_2 = 0, P_3 = 0, P_4 = 2$$

Waiting time:

$$P_1 = 9, P_2 = 1, P_3 = 0, P_4 = 2$$

Turnaround time:

$$P_1 = 9 + 7 = 16$$

$$P_2 = 1 + 4 = 5$$

$$P_3 = 0 + 1 = 1$$

$$P_4 = 2 + 4 = 6$$

Average waiting time:

$$9 + 1 + 0 + 2 / 4 = 3 \text{ ms}$$

- c) Since P_1 was the first to arrive it got CPU.
- P_1, P_2 was given CPU immediately
 - P_3 arrive at 4, & since it was shorter than P_2 & P_1 , it get the CPU & completes its execution at 5.
 - P_4 arrived at 5. Among P_1, P_2, P_4, P_2 was shortest. It got the processor again.
 - P_4 got CPU & completed execution & P_1 get the CPU at last.

Conclusion:

Preemptive proved to reduce starvation, the waiting time is improved.
